

1. Define finite automata.
2. Illustrate the parse tree for given grammar .(input string will be given)
3. different types of parser with examples.
4. recursive-descent parser and the concept of backtracking in parsing.
5. construction procedure of LL(1) parsing table. (mention the steps and rules)
6. FIRST() and FOLLOW() sets and construct the LL(1) parsing table
7. three-address code
8. quadruple, triples and indirect triples for given expression
9. Comparison among quadruple, triples and indirect triples based on their advantages and disadvantages.
10. symbol table and it's importance
11. linked list and hash table techniques used for symbol table implementation.(describe with diagram)
12. division hashing method using the following keys .hash function will be given
13. code generation and describe it with suitable examples.
14. code generation algorithm.
15. the code generation issues.
16. code optimization and the importance of code Optimization.
17. the Control flow graph for given code
18. Compare compile-time errors and run-time errors with suitable examples.
